BNPL

Visual Flow Guide

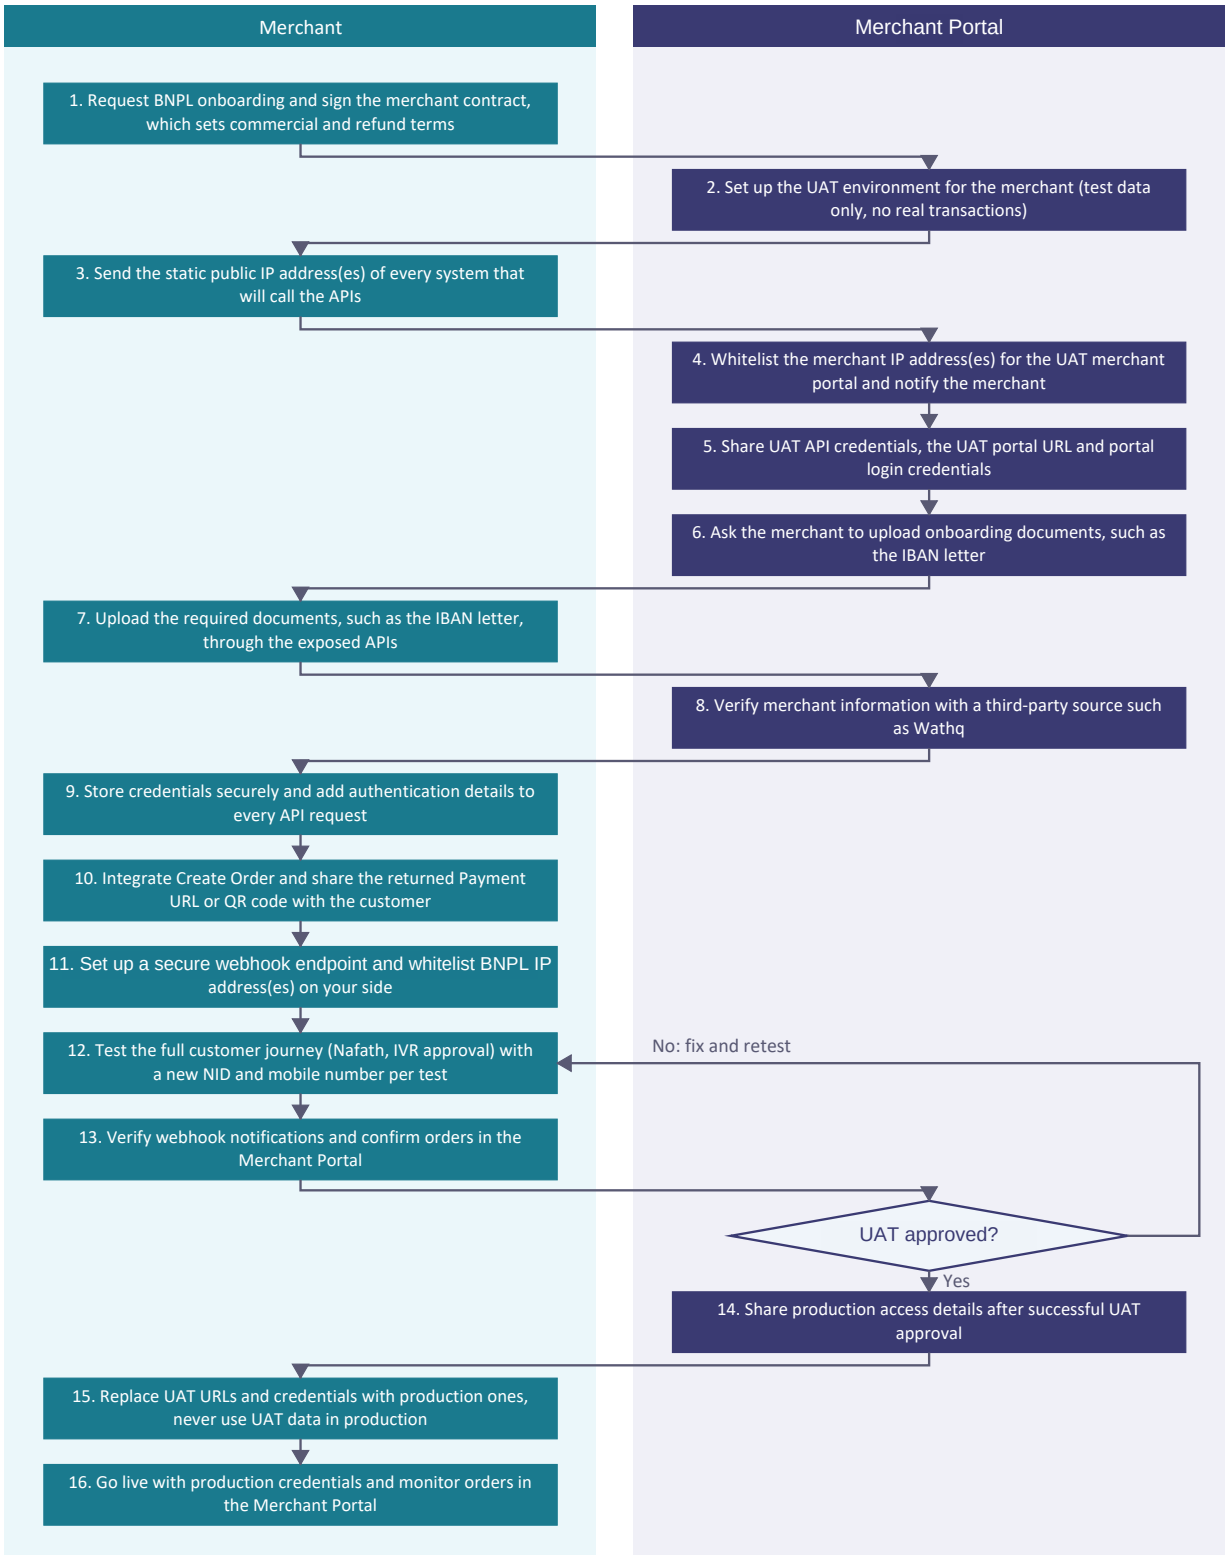

Diagrams and screenshots showing merchant onboarding, API integration, the merchant portal and the customer journey

1. Introduction

How a merchant is onboarded to Buy Now, Pay Later (BNPL), step by step.

1.2 Merchant BNPL Onboarding Flow

From contract signing and UAT setup to going live in production.

3. Integration Overview

How merchant systems connect to BNPL, from order creation to payment completion.

4. Technical Integration

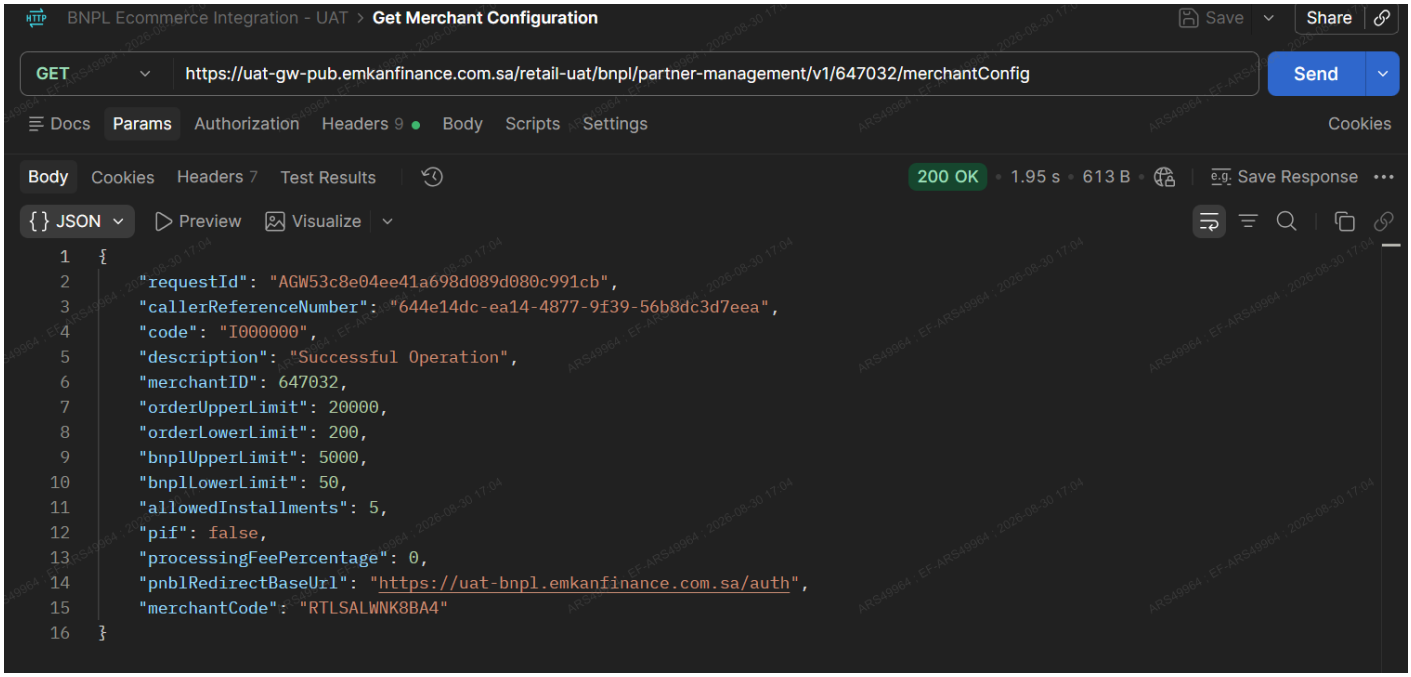

Technical setup needed to connect merchant systems to BNPL.

5. API Specification

The BNPL APIs that merchant systems call, shown with sample Postman requests and responses.

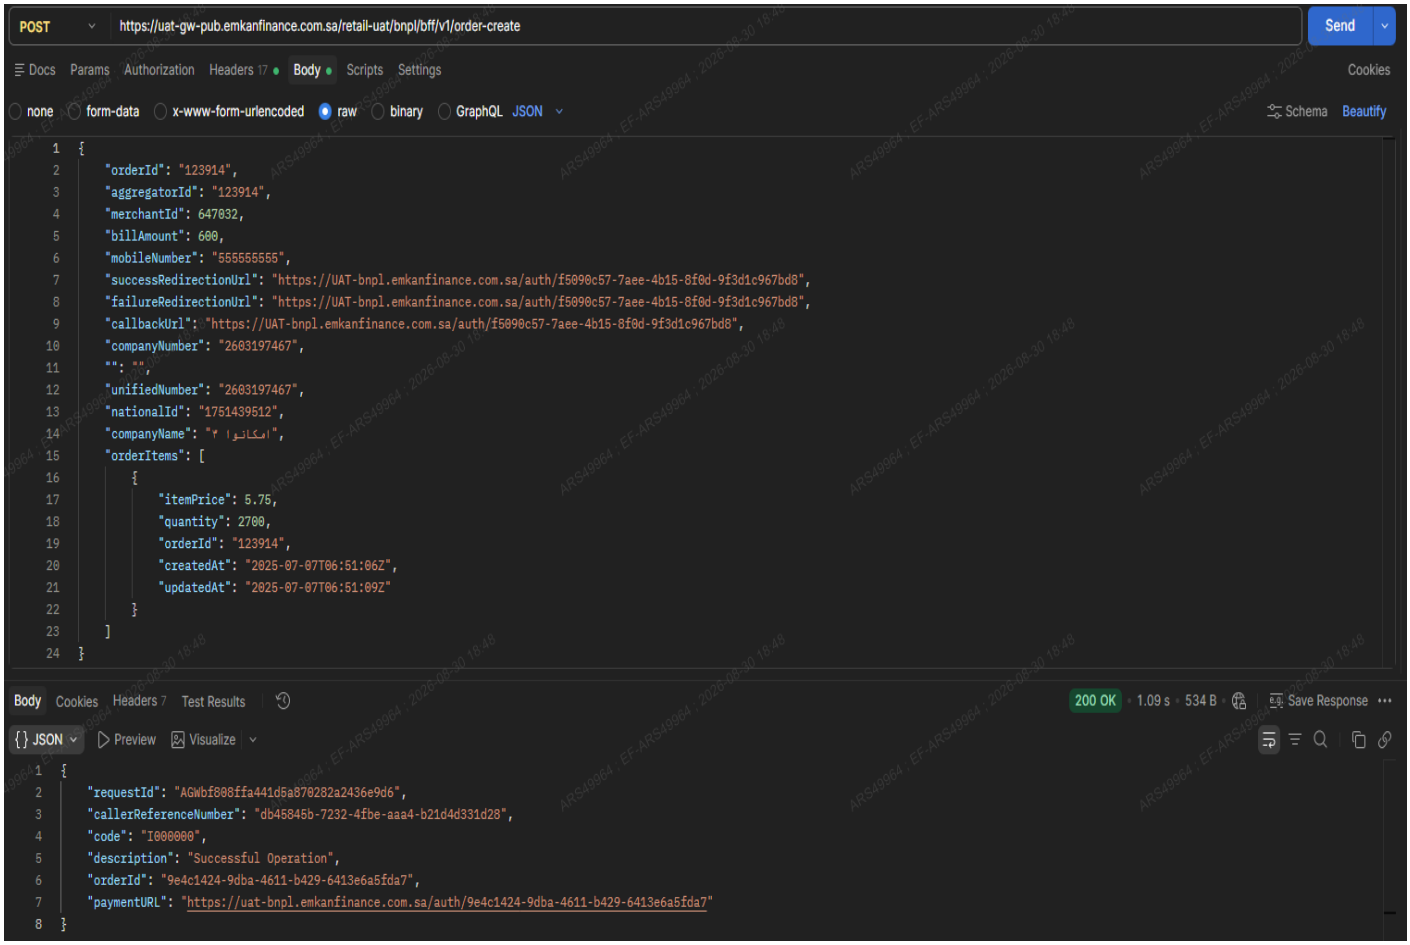

Get BNPL Merchant Configuration

Returns the merchant configuration used for the BNPL integration.

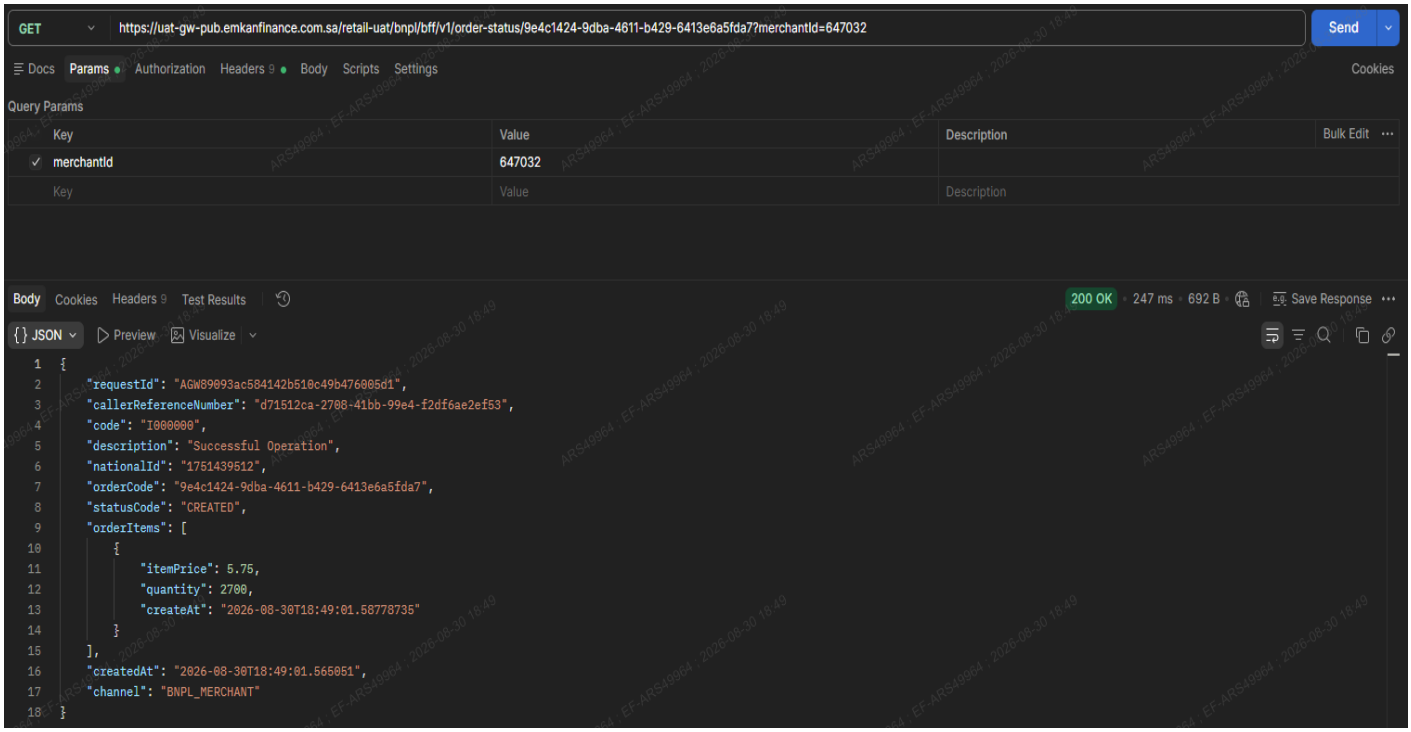

Create BNPL Order

Creates a BNPL order and returns the payment link or QR code to share with the customer.

Get BNPL Order Status

Returns the current status of a BNPL order.

6. UAT Guidelines

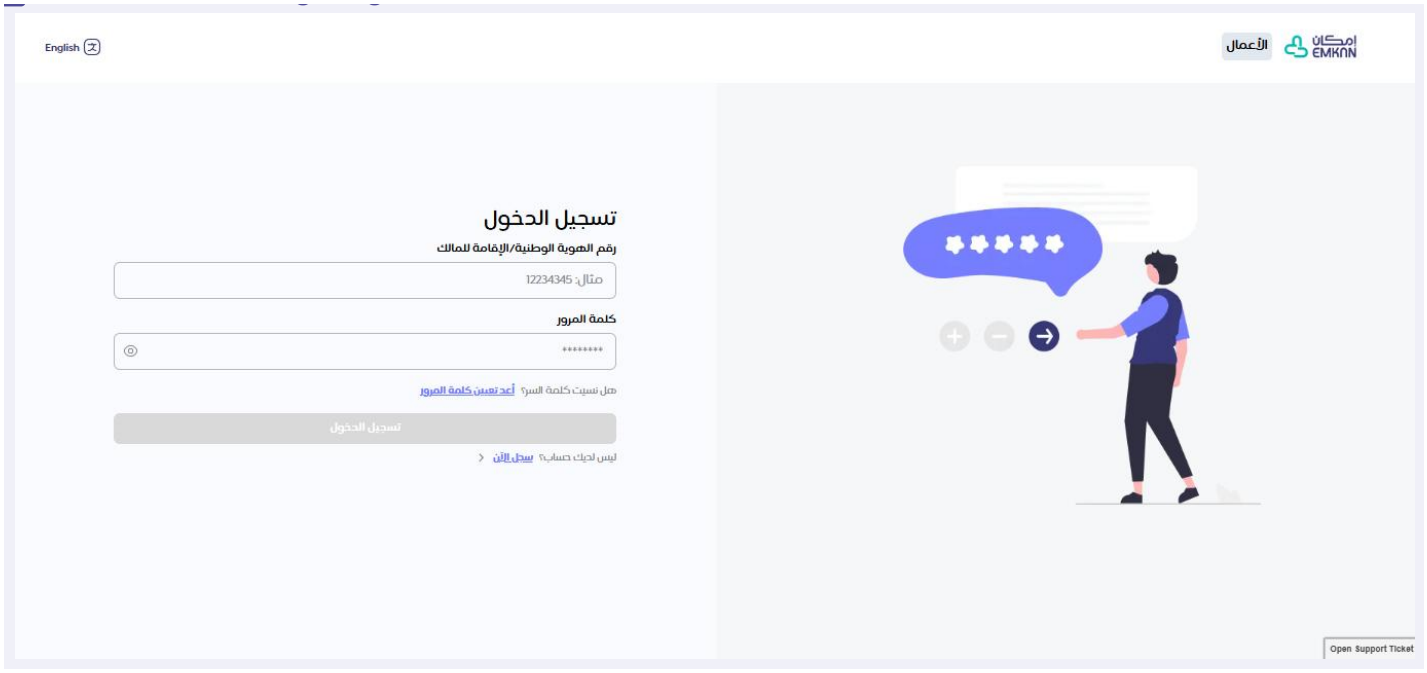

How to test the BNPL journey in the UAT environment, using mock OTP and test cards.

7. Merchant Portal

The portal where merchants log in, track orders, create new orders and view their profile.

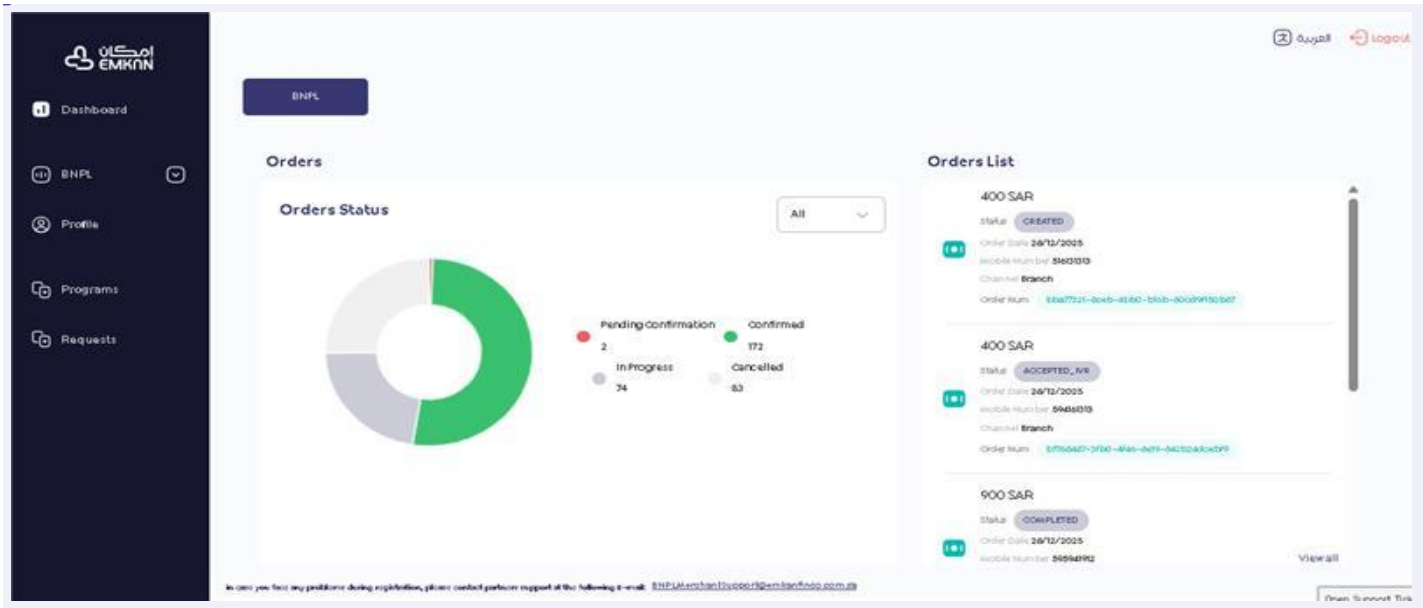

7.1 Portal Access

The merchant signs in to the portal after IP whitelisting.

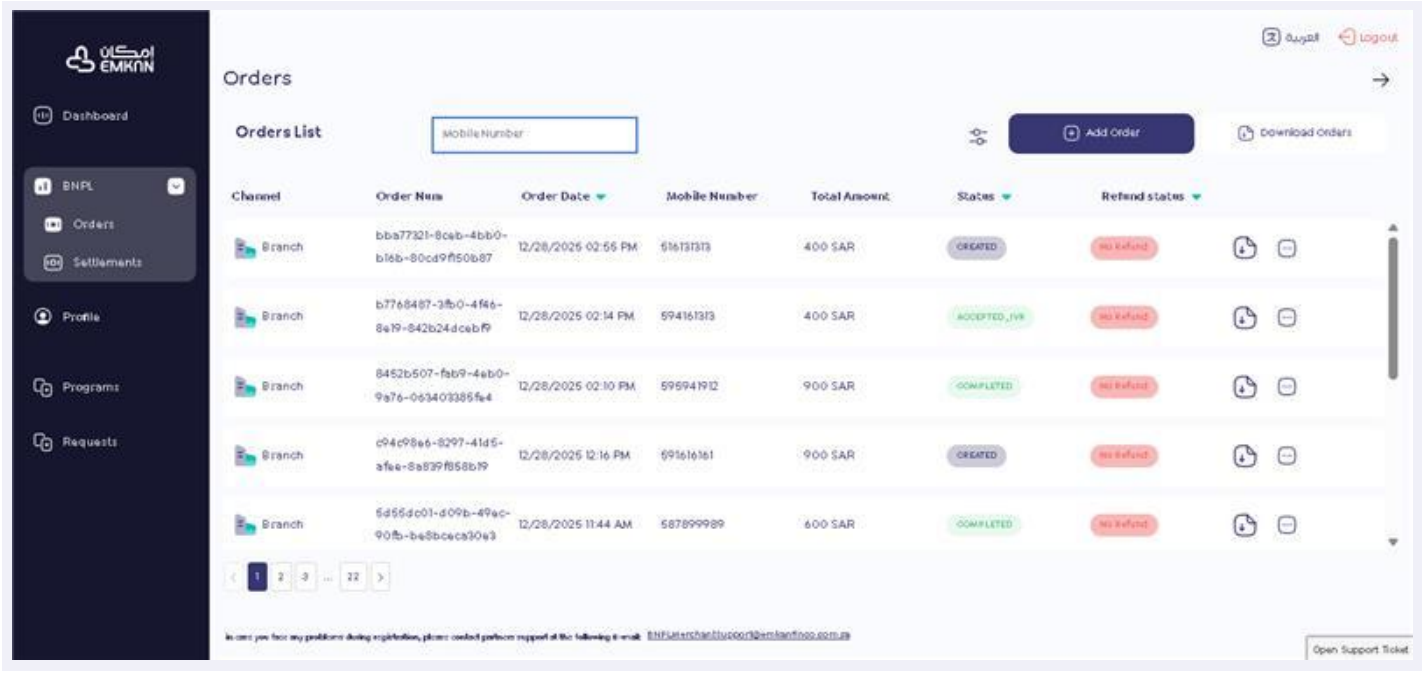

7.2 Dashboard Overview

An overview of the merchant's BNPL activity after login.

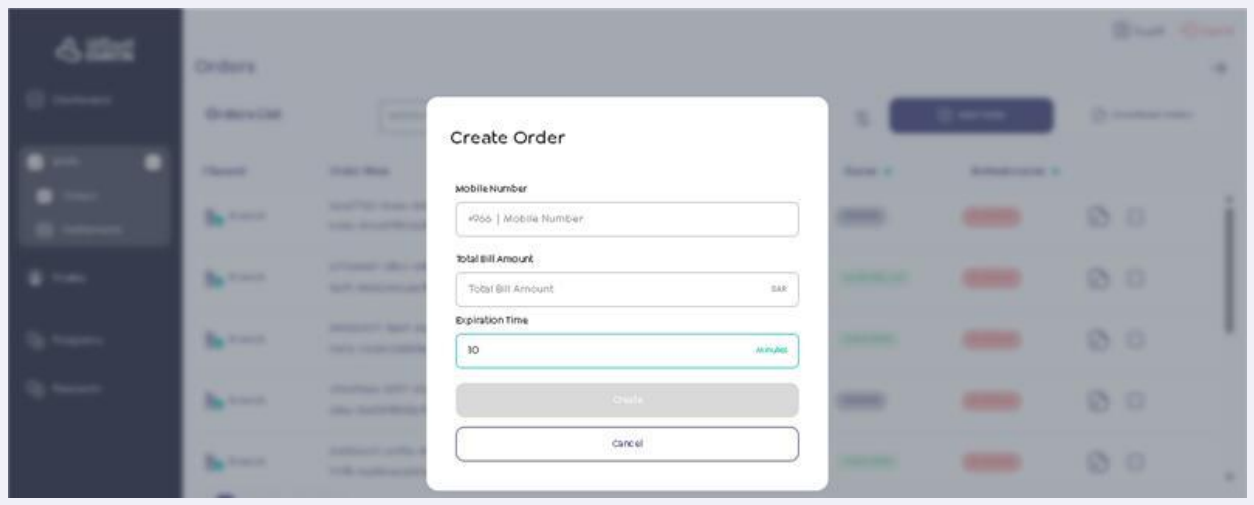

7.3 Orders Page

All BNPL orders created by the merchant, shown in a table.

7.4 Creating a New Order

The merchant enters the order details. A QR code is then generated, or a payment link is provided to share with the customer.

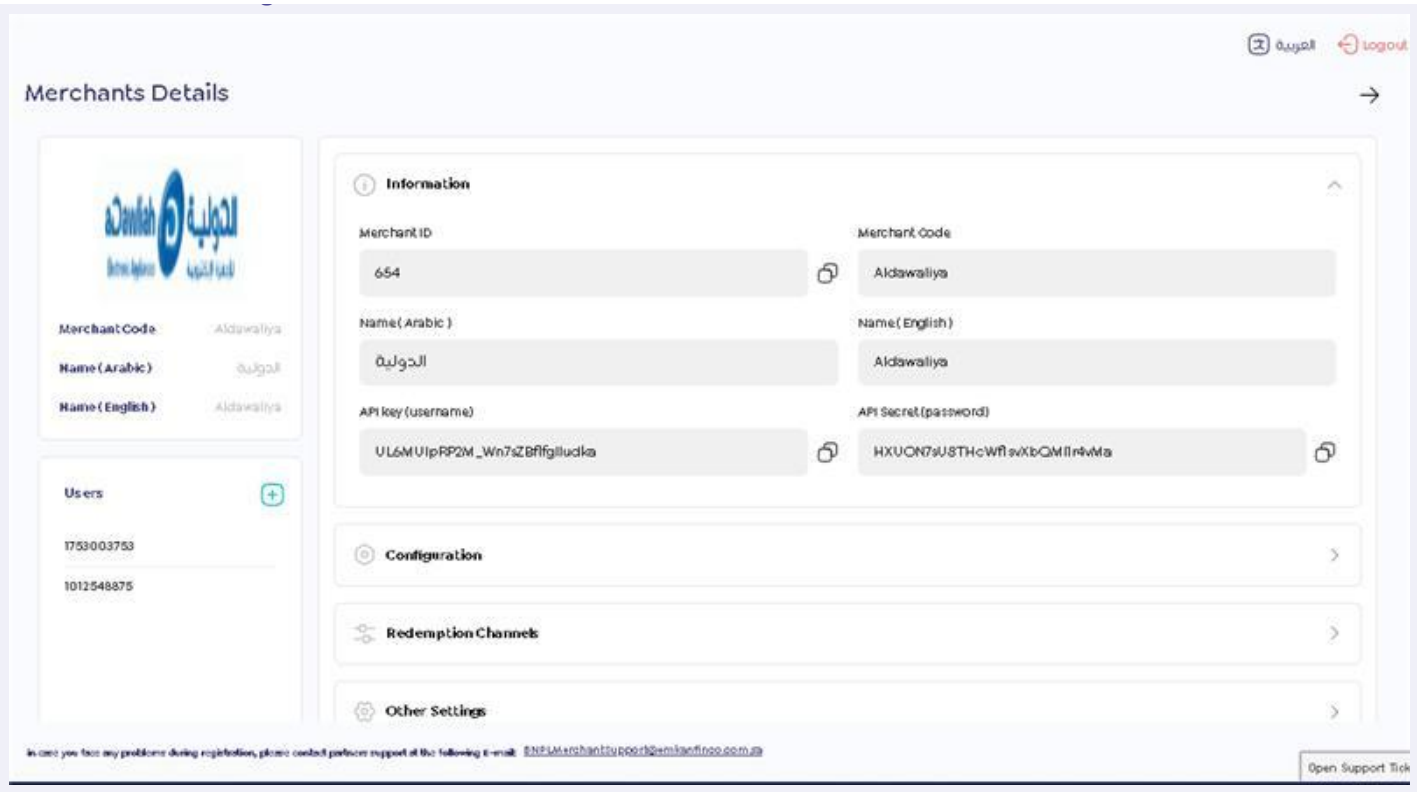

7.5 Order Status & Refund Requests

The status of each order is shown, and refund requests can be raised from the portal.

7.6 Merchant Profile

The merchant's registered details, including Merchant ID and Merchant Code.

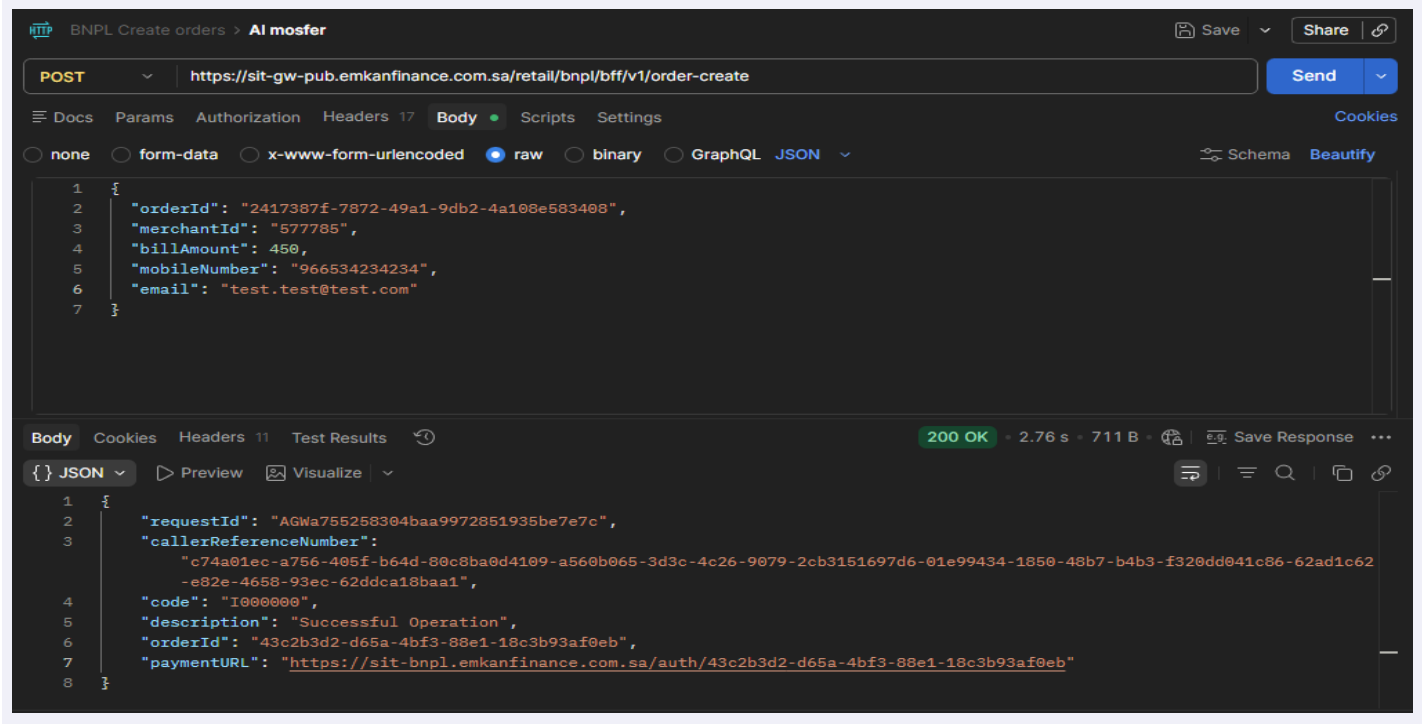

8. Customer Journey

The end-to-end customer journey in the UAT environment, for new and existing customers. Existing customers only need OTP verification.

8.1.1 Order Creation

The merchant creates the order, which generates a payment link or QR code for the customer.

8.1.2 Access Payment Link / QR Code

The customer opens the payment link or scans the QR code.

8.1.3 Customer Information

The customer enters their personal details.

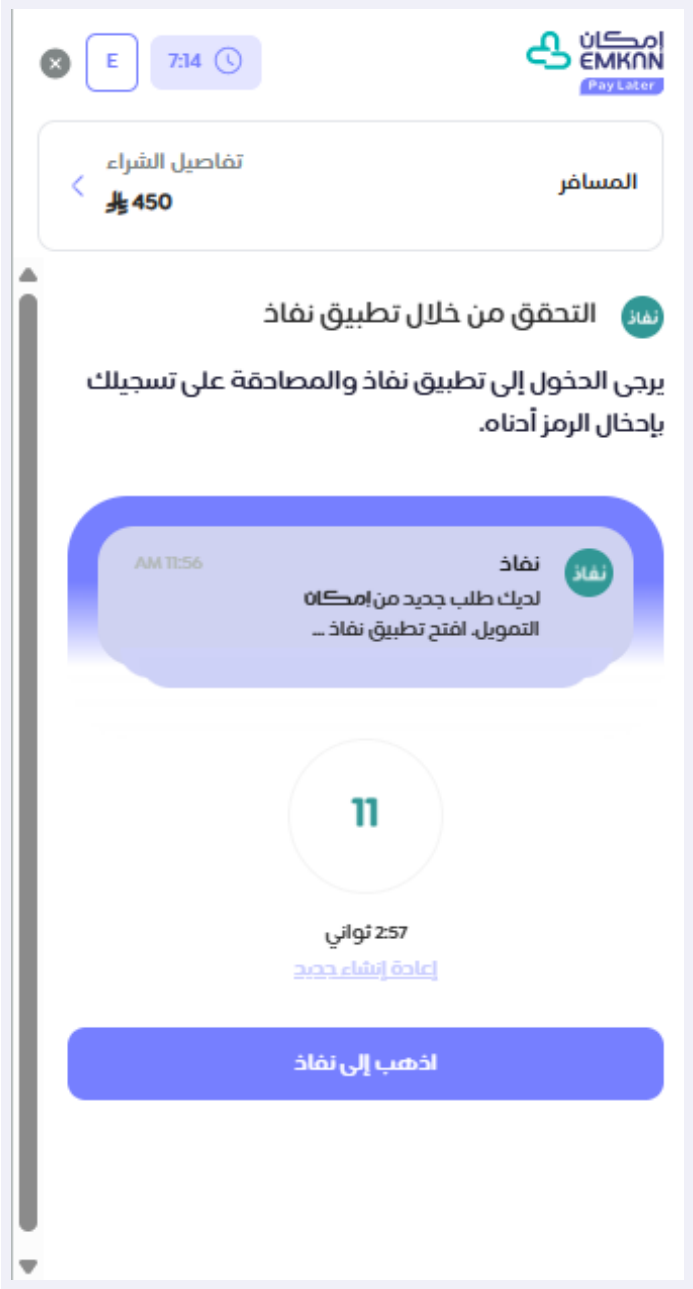

Before the application is created, customer eligibility checks run partly in the Customer microservice and partly on the Newgen side.

8.1.4 OTP Verification and Nafath Authentication

The customer confirms an OTP, then authenticates through Nafath. In UAT, the OTP is mocked and Nafath is approved automatically.

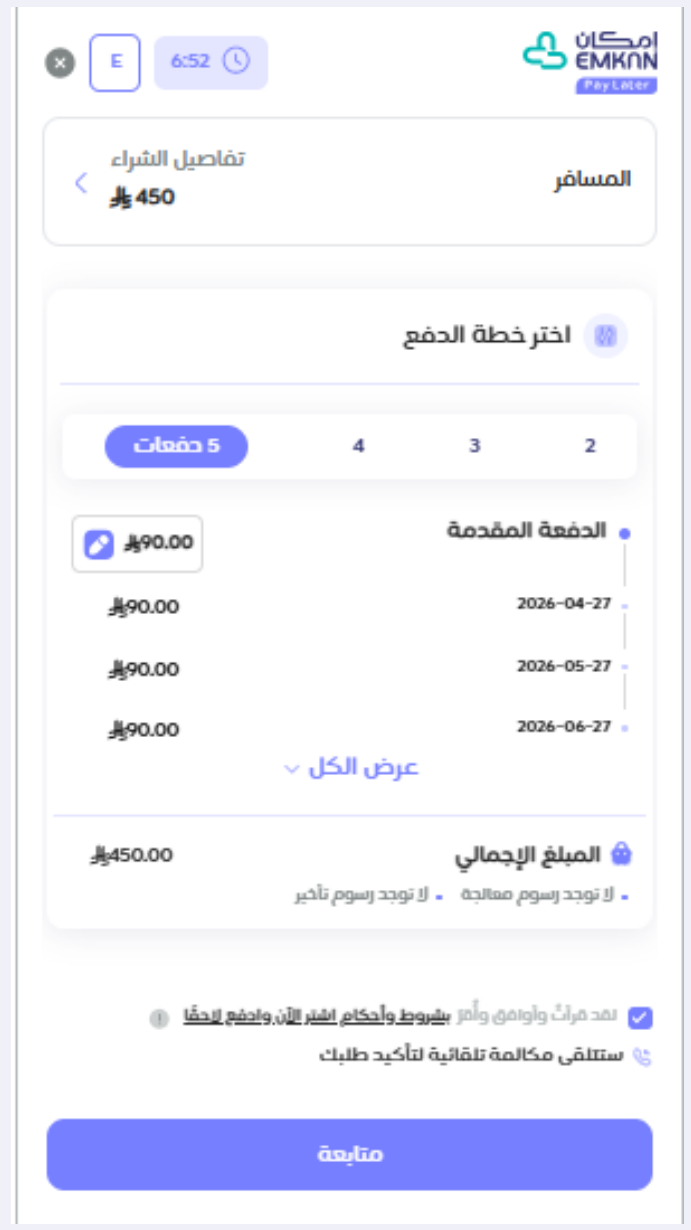

8.1.5 Additional Information

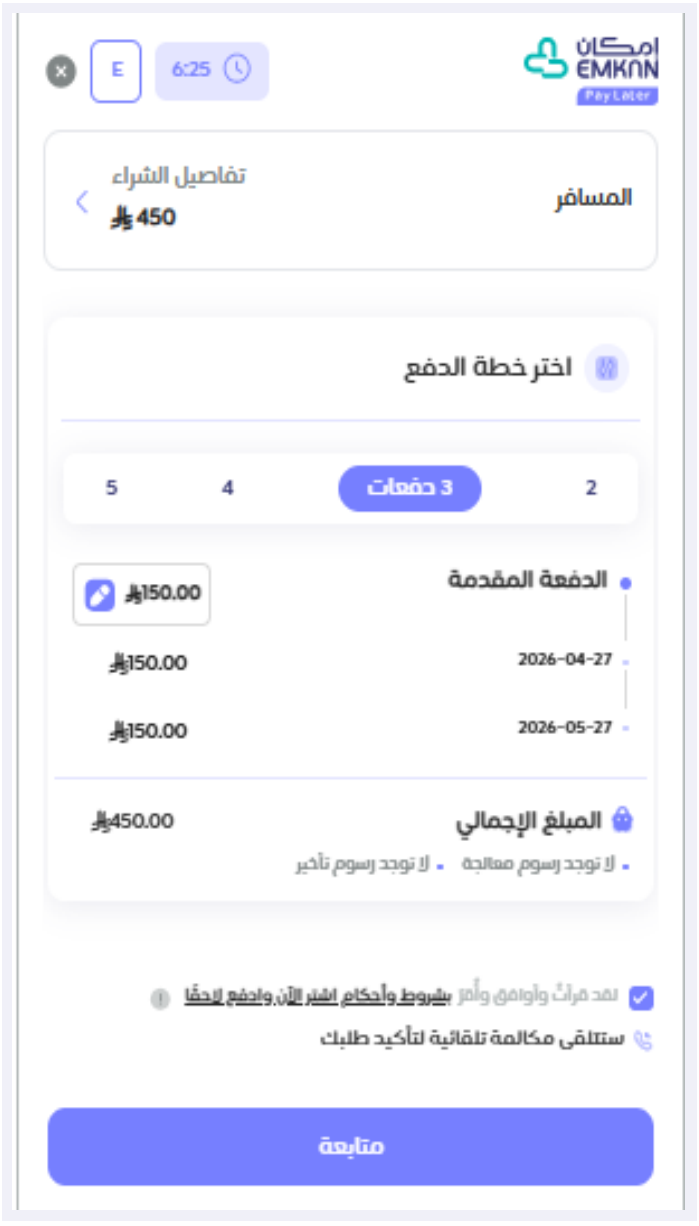

The customer may be asked for extra details, such as the number of family members. This does not affect the decision.

8.1.6 Final Offer & Installment Selection

The customer chooses the installment period or adjusts the down payment within the allowed limits.

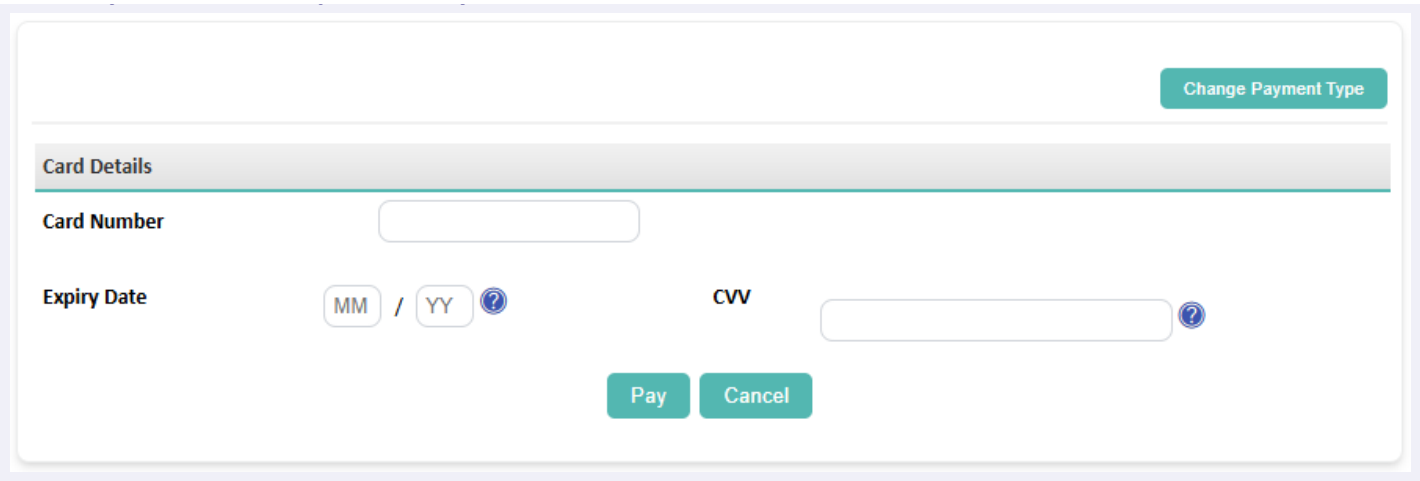

8.1.7 IVR Call Verification

An automated IVR call confirms the order. Approval typically takes about 30 seconds.

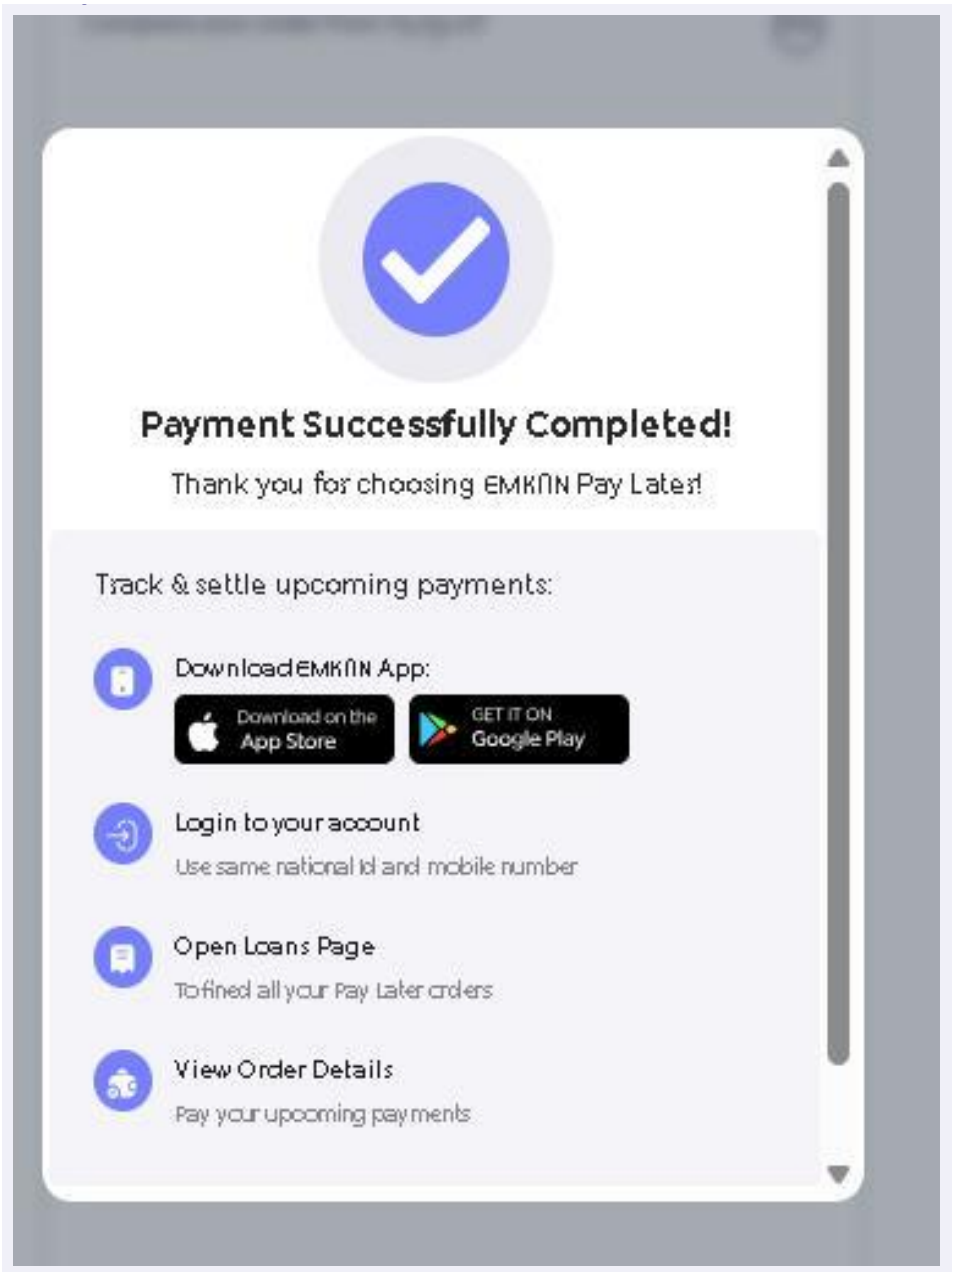

8.1.8 Down Payment

The customer is taken to the Neoleap page and pays the down payment using UAT test card details.

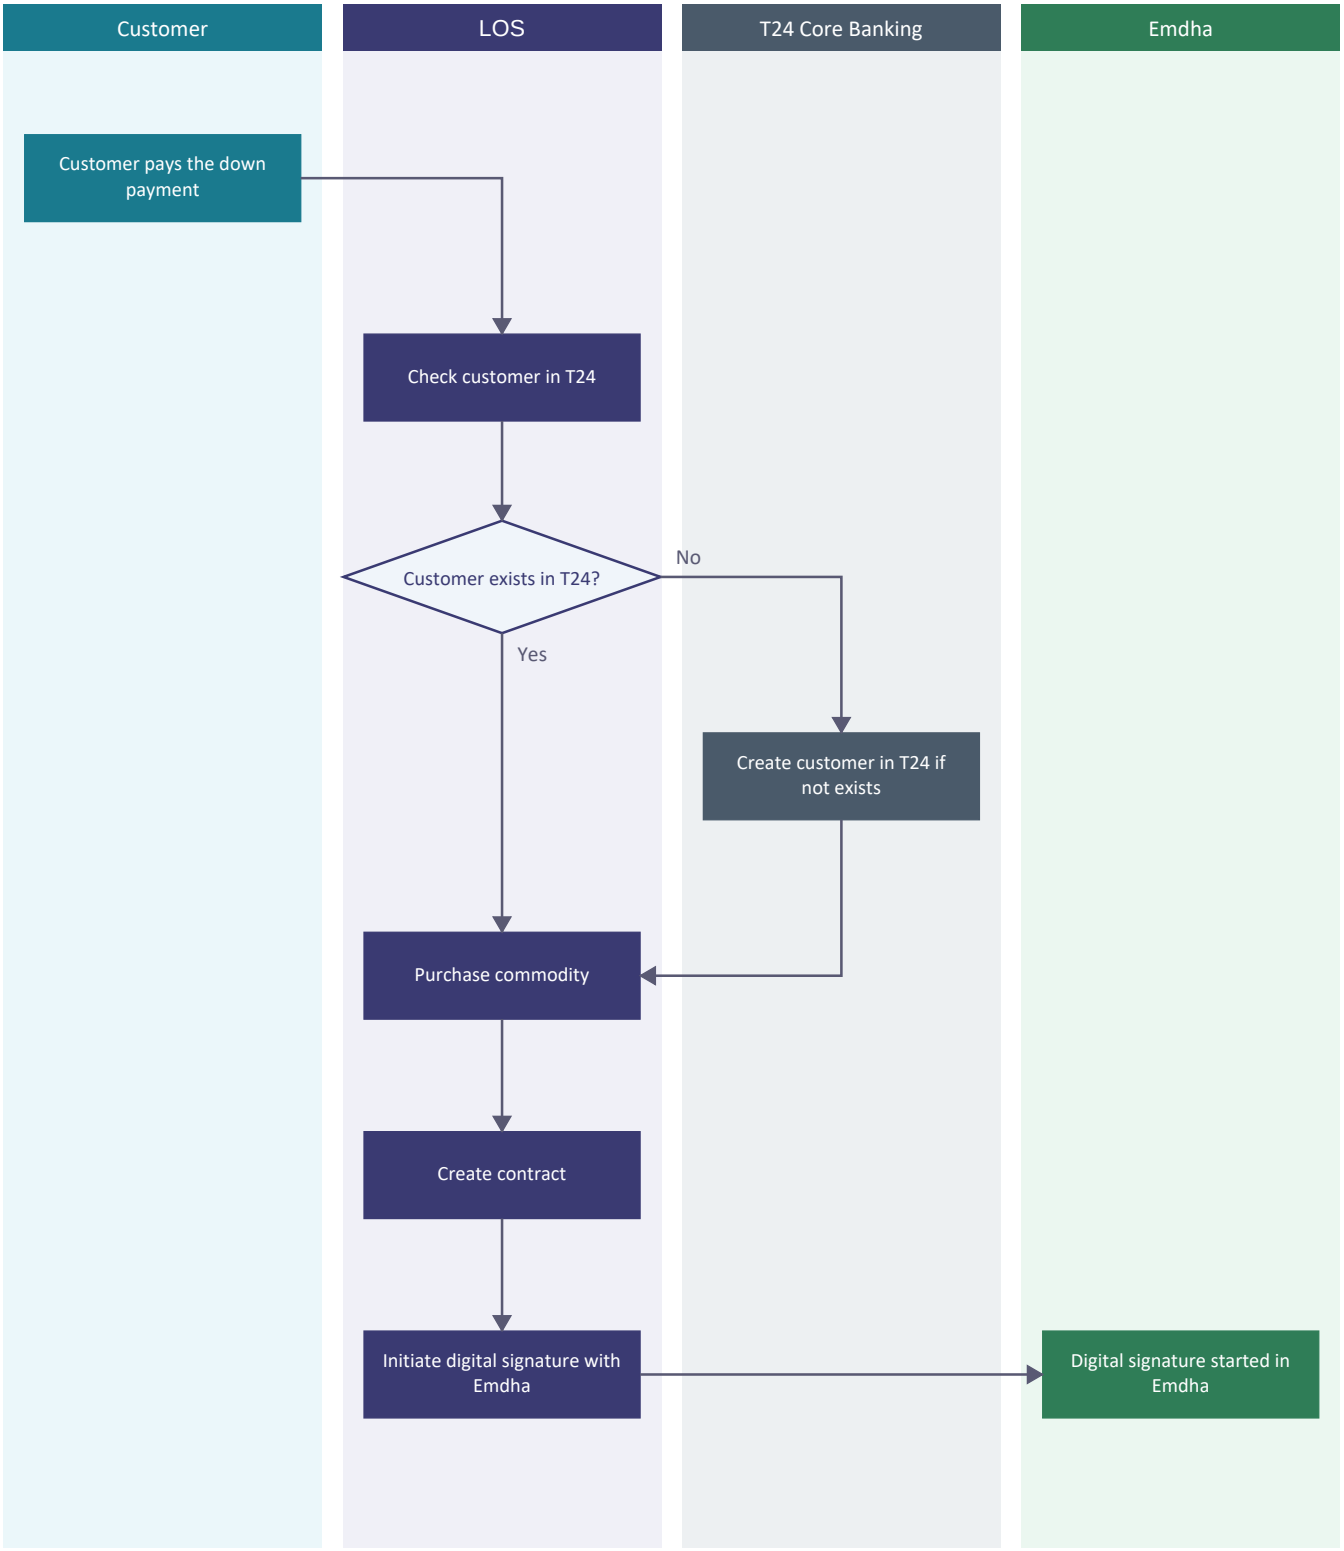

8.1.9 Payment Confirmation & Order Completion

The order is completed after the down payment is confirmed.

8.2 LMS Journey

After the down payment, the LMS checks the customer in T24, creates the customer if needed, purchases the commodity, creates the contract and starts digital signature in Emdha.

9. RMA Settlement

RMA is configured for the merchant. At the end of each RMA period, the total amount of the orders passed during that period is transferred to the merchant account.
